Summary – Portsmouth Water consumer research into water resources 2021/2

Deliberative Qualitative Research January 2022

- Online community plus 8 online focus groups
- 36 participants incl. 20 household bill payers, 5 future bill payers, 5 non-household customers
- Including customers with range of vulnerabilities

Portsmouth Water Online Panel Survey March 2022

- Self-selecting sample from randomised email send
- 700 panellists took part household bill payers
- Including customers with range of vulnerabilities
- Data weighted to match known age & gender

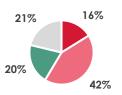

Compared to other environmental concerns, water resources are not top of mind, although when prompted, over half of panellists think water resources in the region are to some extent limited.

"[Water resources] don't feel as important because we have plenty of water to go around. We are a water-rich country" (HH future bill payer)

- Limited to a small extent
- Not affected plenty of water
- Don't know

Upon discussing in deliberative research, customers are able to weigh up the pros, cons and impact of priorities related to water resources:

<u>Higher</u> importance

Fixing leaks

Encouraging customers to use less water

New ways to supply water Upon reflection seen as a key priority. A useful short term solution, **and** a sustainable long term fix

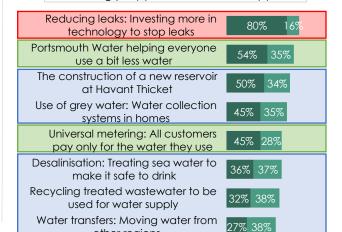

Acknowledge some responsibility lies with customer; can tackle with education. A long-term and accessible option

Circumstantial: 'It depends on how much of a crisis we're in - if we're going to run out then it's really important isn't it" Panellists show greatest support for fixing leaks, followed by helping reduce demand, and then schemes to increase supply:

nes to increase supply:

Strongly support

Tend to support

Consistently, both the qualitative and panel research suggest a broad hierarchy of preference:

2

USING LESS WATER

3

other regions

INCREASING SUPPLY

After being more informed about two specific water resources schemes, the majority are supportive:

Universal smart metering

of the panel support universal smart metering once they have seen a description of what smart meters are, the benefits, and the cost of the scheme for Portsmouth Water*

 The 14% who do not support it have concerns over water bill affordability and negative perceptions of smart energy meters.

of the panel support water recycling at
Havant once they have seen a description of
what water recycling is, its benefit, and the cost
of the scheme for Portsmouth Water*

9% are actively against it

 Qualitatively, customers say they need more information to understand the treatment, & have some worries about chemicals.

Portsmouth Water consumer research into water resources 2021/2 – Stimulus

The more detailed descriptions of specific local schemes shown to panellists are below:

Universal smart metering

Having a water meter means you only pay for the water you use. This encourages customers to be more careful with water, and so reduces pressure on water resources.

Smart meters are a new kind of meter that let you see on your smartphone or computer how much water you're using in real time. This helps you better understand how you can save water. Smart meters also allow Portsmouth Water to identify and fix leaks.

A programme of universal smart metering means all Portsmouth Water customers would receive smart meters along with support and advice from Portsmouth Water on water efficiency.

Cost: £80 million

Benefit to water supply: 20 million litres a day

Environmental / community impact: Short-lived installation disruption in streets

Water recycling in Havant

Predictions suggest that five water recycling schemes will be required in South East England by 2050. One of these is proposed to be located in Havant.

Water recycling is where highly treated wastewater is returned to the environment (in this case into the new Havant Thicket Reservoir) and used to supplement our natural water supplies.

The treatment that recycled water goes through is far more significant than the treatment normal wastewater receives. Recycled water would be used in relatively small volumes to supplement the spring water that will be in the reservoir.

When needed, the water is then re-abstracted from the reservoir, treated again to drinking water standard and supplied to customers.

Cost: £ 130m

Benefit to water supply: 15 million litres per day

Environmental / community impact: The extra treatment will need a new treatment works building and will use a lot of energy. This energy will need to come from sustainable sources.
